

# Font Guide for an Agri-Tech Portfolio

Font pairing recommendations for a modern agriculture / hydroponics portfolio site

---

## Recommended Pairing

**Headings:** Fraunces (serif)

**Body text:** Inter (sans-serif)

This combination reads as modern agri-tech — professional and tech-forward, with just enough organic warmth from the serif headings to nod to the agriculture side without looking like a traditional farm brand.

## Modern Agri-Tech Feel

### Inter / General Sans — body text

Clean, professional, reads well on tech-forward sites. Excellent legibility at small sizes.

### Fraunces / Lora — headings

Adds organic warmth without looking dated. Works well for project titles and company names like “Growloc” or “Hydroponics.”

## Earthy but Professional

### Source Serif 4 / Merriweather — headings

Slightly more traditional in feel, still fully credible for a professional portfolio.

### Work Sans / Karla — body

Friendly and approachable, pairs well with a warmer serif heading.

## What to Avoid

- *Overly rustic or handwritten fonts (e.g. Amatic, chalkboard styles) — reads as “farmers market flyer” rather than “agri-tech project lead.”*
- *Overly futuristic or tech fonts (e.g. Orbitron) — clashes with the agriculture side of the story.*

## General Rules of Thumb

- Pick two fonts max: one for headings, one for body (or one family with varied weights).
- Prioritize readability at small sizes for body text.

- Choose a family with a good weight range (300–700) to build hierarchy without switching fonts.
